

Rack Safety Inspections and Surveys

by SEMA approved rack inspectors

All storage installations will inevitably suffer damage during use. End users of pallet racking and industrial shelving systems have a legal requirement under PUWER (1998) to have these installations inspected by a "technically competent person" on an annual basis.

Our Rack Safety Inspectors are certified as SEMA approved Rack Inspectors

The Storage Equipment Manufacturers' Association (SEMA) assess and approve Rack Safety Inspectors to ensure they meet the Health and Safety Executives requirements for technically competent inspectors.

We can inspect large and small installations anywhere within the United Kingdom

Our Rack Safety Inspection Reports are comprehensive, easy to understand and include an installation layout plan and replacement materials list.

We are able to undertake inspections of automated highbay installations

Our inspectors are fully certified as competent to work at height. All necessary risk assessments and method statements are prepared and agreed in advance along with a safe system of work. We hold up to date Professional Indemnity and Public Liability Insurance.

We can provide bespoke training packages in Rack Safety Inspection

End users of storage systems should undertake their own regular inspections. Our training can be provided on site and includes an extensive practical session.

Rack Verticality and Level Surveys

- **Maintaining tolerances during construction**
- **Confirming construction tolerances before first use**
- **Identifying the causes of operational issues**

We specialise in verticality and level surveys of storage installations. Using digital levels and robotic total stations we are able to measure floor levels to millimetre accuracy and check the verticality of racking without the need to work at height. This specialist equipment allows us to measure and record extensive amounts of data quickly, efficiently and accurately.
